

Sisulizer for Developers

Sisulizer Standard Edition is the ideal software localization tool for Micro ISVs. It covers localization of software written in such popular software development tools like Delphi, Java, Visual Basic and C++, and more. You (or your translators) can localize your software in any human language.

Sisulizer scans your application for translatable data, send your project together with the Free Edition of Sisulizer to your translators, and build the localized version. It is that simple. And because your translators sees the context right away, you have less communication hassle. And best of all, updates are a snap because Sisulizer knows the new, changed, and deleted items with one click. No need to translate something twice.

Sisulizer Professional Edition is our best selling software localization tool. It supports localization of .Net WPF, as well as localization of HTML, and HTML Help to name a few additional platforms to our Standard edition.

The live spell check support in the translation grid helps your translators to create better quality translations. It comes with various report and validation abilities to assist you in creating the best localization of your great software.

Sisulizer Enterprise Edition is the best software localization tool for large-scale enterprises. When you need to localize server databases, or want to take advantage of shared Translation Memory, this is your edition. With our command line tool you can integrate Sisulizer functionality in your software build process.

Sisulizer Edition Comparison Table

The following feature table shows the differences between the Sisulizer editions in deta

Features	Standard	Professional	Enterprise
Tailored for Developers	Developers	Developers	Developers
Open Sisulizer's XML based project file	Yes	Yes	Yes
